

ABSTRACT

COMPOSITION COMPRISING A SEMI-CRYSTALLINE POLYMER AND AN ESTER

The invention relates to a makeup composition comprising a) at least one liquid fatty phase structured with at least one semi-crystalline polymer having an organic structure, whose melting temperature is greater than or equal to 30°C, b) a colorant and c) an ester containing 10 to 40 carbon atoms, the liquid fatty phase, colorant, ester and polymer forming a physiologically acceptable medium.

This composition is in the form in particular of a stick which is smooth on application and which lays down a glossy and comfortable film on keratin materials, particularly the lips.
